

## How to attach the rubber feet to the Derminator®

We supply four rubber feet with the machine. They are included separately in the box.

The feet are useful when the machine is used on a table. They will prevent sliding of the machine. When the machine is used on the floor (with you sitting on a chair or in bed), the feet are useless and may quickly collect a lot of dirt. This is why we supply them separately and made them detachable.

If you choose to use them, you must insert them, using some force and twisting and turning, into the holes in the base of the machine. It helps when you cool the feet in the fridge because the rubber gets harder when it is cold. Do not freeze the feet though, this may make them brittle. You could also slightly wet the feet to make them slide in easier.

**Important: Because the holes in the base are not vertical but under a 15 degree angle, the rubber feet are highly asymmetric, meaning they can only be inserted to fit properly when oriented correctly.** You have to rotate them until they line up properly, as shown below:

If you do not orient them correctly, they will not connect flatly to the base. You can try rotating them into their proper place. If that does not work then you'll need to take them out and repeat the process of insertion, this time correctly.

Especially if you did not cool the feet before insertion or did not push firmly, it will be nearly impossible to insert them fully, just by pushing them in. We suggest that after they have been inserted and verified to all line up correctly, that you carefully grab the machine and push firmly down so that the feet are pushed further in.

**Important: Be careful, when pushing down on the machine, that you do not push anywhere near the display. Only apply pressure onto the edges of the back and front top of the machine, to avoid damage to the display.**
